Logo Layout Tools – Read Me

Two small tools that turn a folder of client logos into an evenly sized, evenly spaced logo wall in After Effects.

What's included

File	App	What it does
`TrimLogos.jsx`	Photoshop	Crops the empty white or transparent border off a folder of logos. Optional.
`LogoLayoutPanel.jsx`	After Effects	A dockable panel that sizes and spaces selected logo layers inside the safe zone.

Step 1: Remove the empty space around each logo

The panel treats each logo's frame (or mask) as the logo's edge, so any border around it throws off the sizing and spacing. Do one of these first.

Option A: trim in Photoshop (quickest for many logos)

1 Put the logos in one folder.

2 In Photoshop, go to **File › Scripts › Browse…** and choose `TrimLogos.jsx`.

3 Pick the logo folder.

4 Trimmed PNG copies are saved in a new **trimmed** folder. Originals are not changed.

5 Import the PNGs from **trimmed** into After Effects.

Vector files (AI, EPS, SVG, PDF) are skipped. Use Option B for those.

To keep the script in the menu, copy it to `/Applications/Adobe Photoshop <version>/Presets/Scripts/` and restart Photoshop. It then appears under **File › Scripts**.

Option B: mask in After Effects

Draw a rectangle mask tightly around each logo on its layer. The panel uses the mask's edges as the logo's size.

Step 2: Install the After Effects panel (once)

1 Copy `LogoLayoutPanel.jsx` into the **ScriptUI Panels** folder:

- Mac: `/Applications/Adobe After Effects <version>/Scripts/ScriptUI Panels/`
- Windows: `C:\Program Files\Adobe\Adobe After Effects <version>\Support Files\Scripts\ScriptUI Panels\`

2 Restart After Effects.

3 Open it from the **Window** menu and dock it wherever you like.

Step 3: Lay out the logos

1 Put all the logos in one comp.

2 Select the logo layers in the order you want them to appear.

3 Choose your settings in the panel and click **Apply**.

4 Tick **Live update** to see changes straight away as you adjust settings. It re-uses the last logos, so you don't need to reselect them.

Each Apply is one undo step, so **Cmd/Ctrl+Z** reverts it.

Settings at a glance

Setting	What it does
Arrange by	Set a number of rows, or a number of logos per row.
Spacing	**Equal gaps**: same space between every logo (best for mixed shapes). **Equal centres**: logos line up in columns across rows.
Min gap	Smallest space allowed between logos, in pixels. Raise it if logos feel cramped.
Keep inside	Title safe, action safe or the full frame.
Title / Action %	Match these to Preferences › Grids & Guides › Safe Margins.
Padding X / Y	Extra space inside the safe zone, in pixels.
Mode	**Balanced**: similar visual weight (recommended). **Fit cell**: as large as possible. **Same height**: all one height.
Weight	Overall logo size in Balanced mode.
Max height	Stops tall logos growing too big, as a fraction of each logo's slot width.

Settings are remembered between sessions.

Tips and troubleshooting

- **A logo looks too small or off-centre.** It probably still has a border. Trim it in Photoshop or mask it in AE.
- **"Without a mask" message.** Normal for logos trimmed in Photoshop. Otherwise it flags logos you forgot to mask. Window › Info lists them.
- **Some layers were skipped.** The panel ignores layers that are parented or have keyframes on anchor point, position or scale. Window › Info lists them.
- **A logo on a coloured box wasn't trimmed.** The Photoshop script only removes white or transparent borders. Mask that one in AE.
- **Logos in the wrong order.** Deselect everything, then click the layers one by one in the order you want and Apply again.
